

Throughout history, education has found a paramount importance among not only young people but also elderlies. The well-educated people, elite persons, usually have been praised by others during past and know. No one can deny the effect of higher education in today's technological world. Due to its undeniable effects, many scholars have studied education from different points of view. One controversial question is often raised regarding this issue is that whether higher education is easier to achieve these days rather than past or not. Some people may hold this viewpoint that reaching the highest level of education does not need anything but the individuals' stubborn determination. Some others may take an opposite viewpoint and believe that it's absolutely easier to become a well-educated now than in the past. From my own perspective, the latter is true and I will pinpoint the most outstanding reasons.

One of the most important reasons which comes to mind first is that families nowadays are more willing to see their children attend universities than the past. Parents usually try to create all **opportunities** that might be **necessary** for their children to prosper. An empirical study over 30000 families across the United States shows that 89 percent of them dream their children continue their education and become an important person. This clearly clarifies the fact that parents have more attention toward children education and help them to **achieve** higher education level.

Another equally important reason is that from the historical/psychological standpoint, compared to past, people are expected to be well-educated and this **serves as an incentive** for people to study further. For Instance, a teenager might dream of becoming an employee in the British Petroleum Company. Soon he would understand that his dream will not come true unless he studies engineering in the university. Unlike this example, people in the past were mostly not working in a place rather than on their farms and lands. They usually became farmer or landowner. They did not need high education to prosper in their vocation. Thus, the prospect of retaining a good occupation serves as a powerful motivation to become highly educated these days.

The last but not the least reason is that nowadays state-of-the-art technologies influence not only education but all aspects of our lives. The teachers teach students with more modern and updated tools and give them powerful incentive to learn more and more. Thanks to communication technologies, the students could collaborate in different research project all around the world and broaden their knowledge of various subjects and fields. This obviously demonstrates the fact new inventions in technologies especially computers and mobiles lead people to be more educated nowadays.

To wrap up, I deeply believe that becoming a well-educated person is much easier knows since the families support the children to become so. Also, the technologies significantly reduce the time and efforts that a person needs to gain more information. Furthermore, the future vocation can give an effective incentive to someone to study more to reach his or her goals. All in all, people nowadays are more likely to have a chance of becoming well-educated and it is anticipated that in the future the governments also spend more money towards education facilities as well.
